

# 01 Overview

**User Story 1:**

As developers, when implementing new software features, we want to be able to test them right away (as we go).

**User Story 2:**

As developers, when integrating new features into our software, we want to make sure that we don't break anything in the overall system.

## Approaches

### Smoke Testing

Taking from electronics: If you turn on a PCB and no smoke can be seen, it probably works.

### Unit Testing

Testing individual functions/VIs in the program to give a wide range of inputs and check that the outputs are correct - things like the Unit Test Framework, Caraya, VI Tester etc. can help you with this.

### Integration Testing

This involves testing how modules of your program interact with each other - for example testing APIs and communication between VIs.

### Regression Testing

Running existing tests after introducing changes to your software, in order to make sure that the existing code base still works as expected.

### System Testing

Testing the overall system functionality according to a test plan

## End-to-end Testing

Test from the end user's experience by simulating the real user scenario and validating the system under test and its components for integration and data integrity.

## Acceptance Testing

Final demonstration to the customer in order to achieve acceptance of delivery and go for invoicing.
