

Gitflow

gitflow is a branching model for git created by Vincent Driessen. It forms an elegant mental model that is easy to comprehend and allows team members to develop a shared understanding of branching and releasing processes.

Detailed information can be found on [A successful git branching model](#).

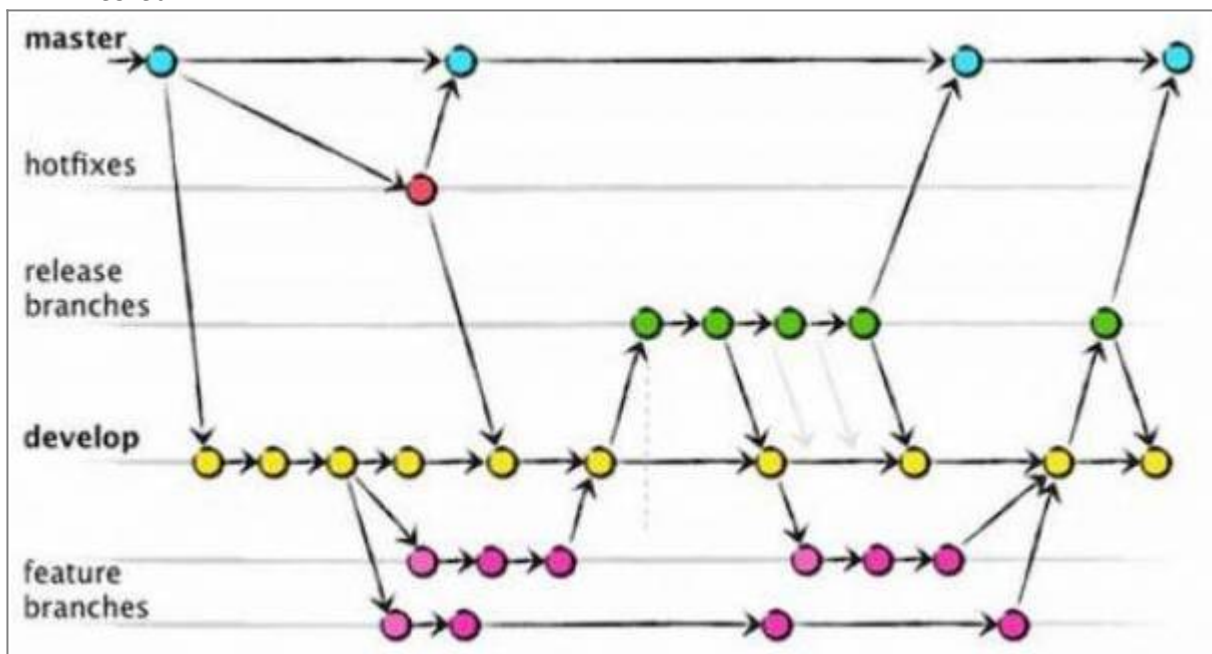

The Git Tower team wrote another detailed description on [how to use gitflow](#) with a GUI tool.

Basic usage and effect of git-flow operations on the command line:
<https://danielkummer.github.io/git-flow-cheatsheet/>

In a nutshell:

- use different branches for different purposes
- master holds only releases (and bugfixes)
- develop holds the latest version under development
 - only tested features are merged into develop
- 4. all features are developed in single, separate branches called feature/xxx
 - these feature branches are merged back into develop after the feature is finished and tested
